Introduction

Magnetosheath Jets

What: Enhancements of dynamic pressure above the general fluctuations level

Where: Magnetosheath

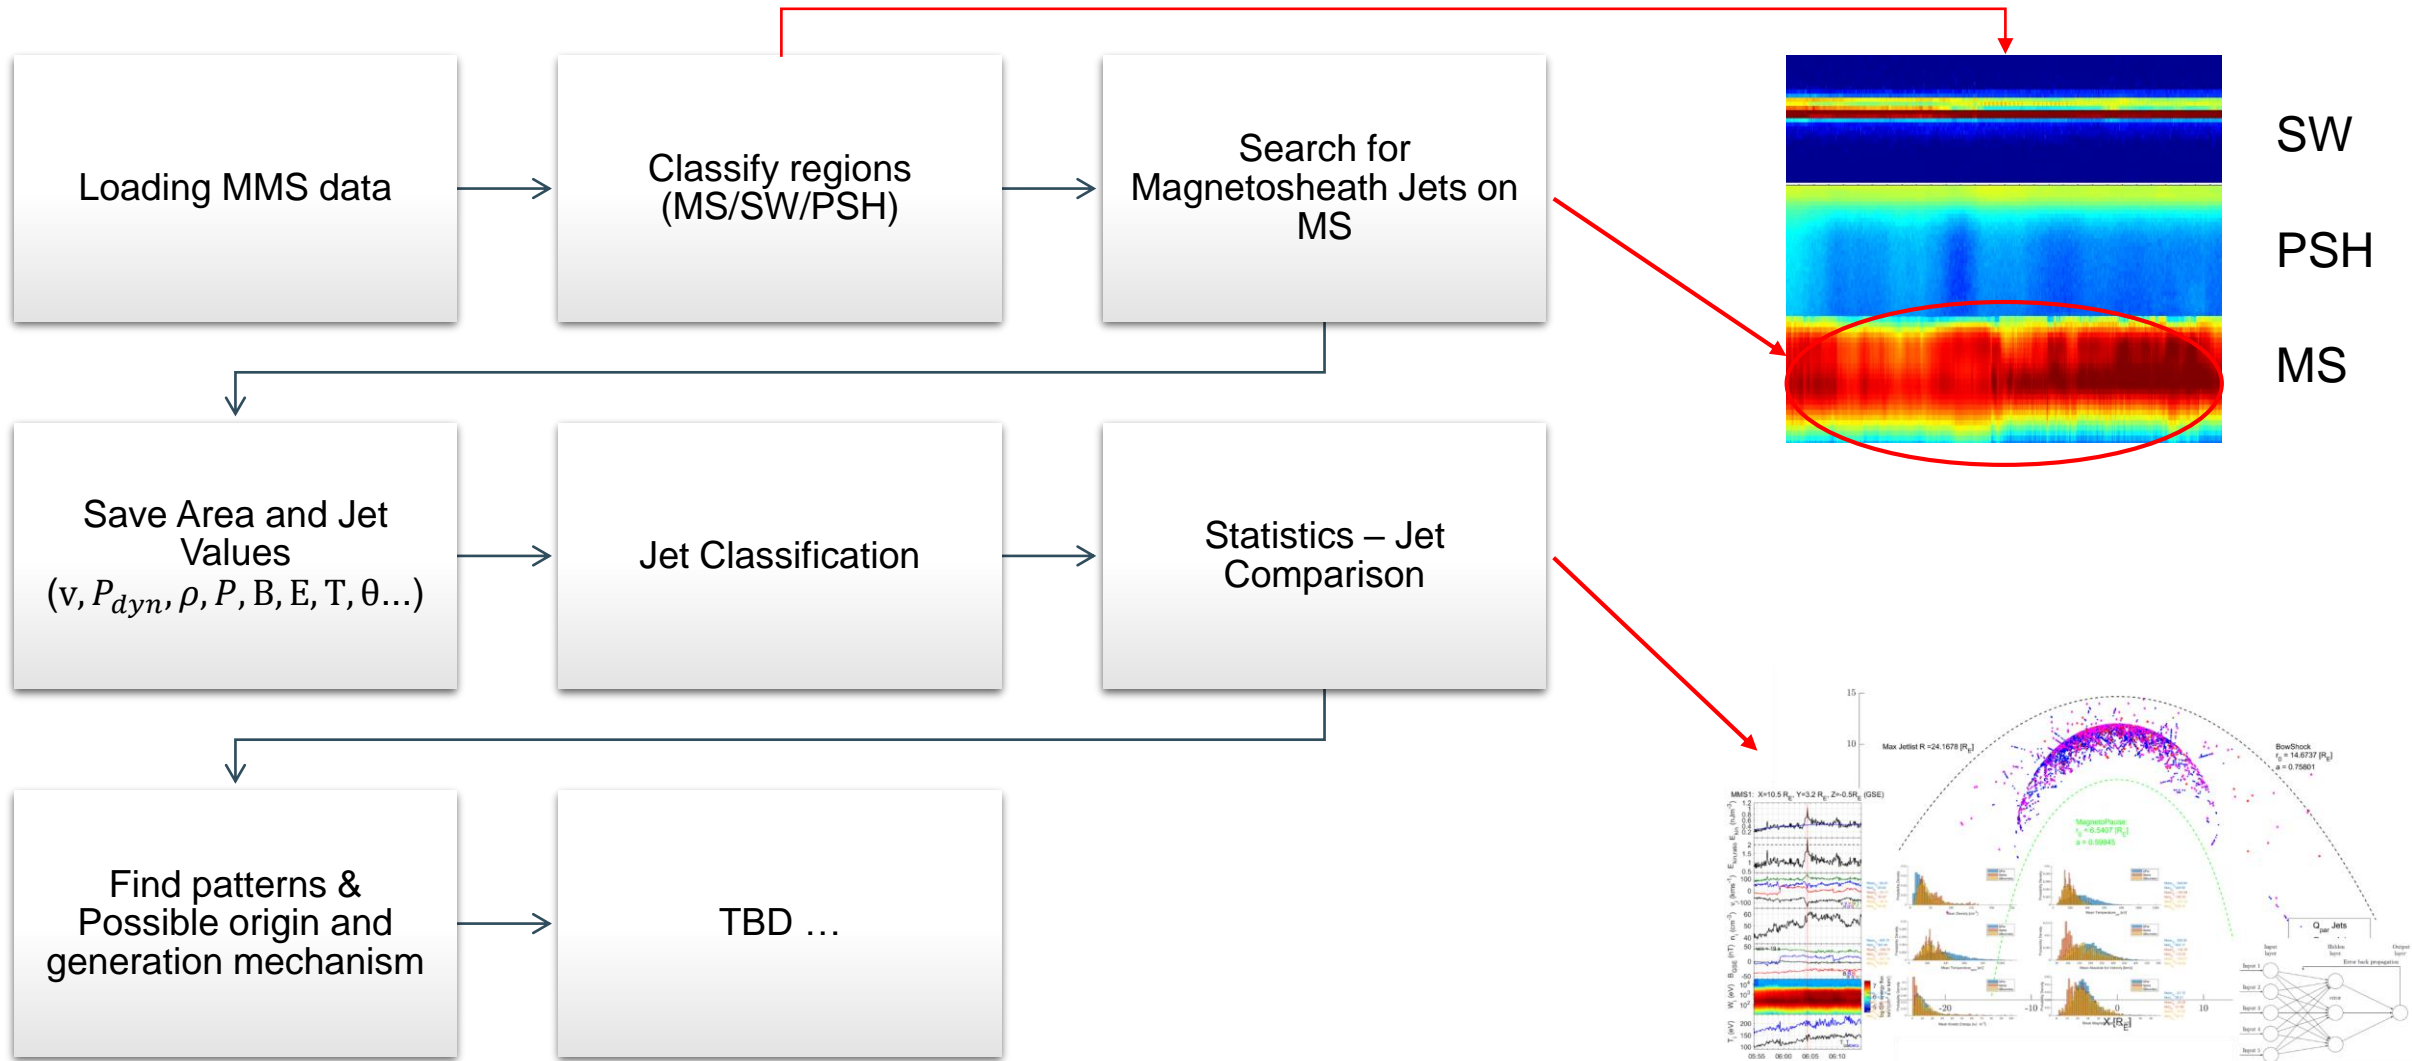

Data: MMS (Magnetospheric Multiscale Mission)

Why: Interaction of SW & Magnetosphere, magnetopause reconnection, radiation belts, auroral features...

Palmroth Minna et al. (2018)

Searching for Jets

Motivation – Main Subcategories

L. B. Wilson (2016)

Jets are found mainly in Quasi-parallel shock ($\theta_n < 45^\circ$). However, fluctuations also found in Quasi Perpendicular regions.

How Jet look like – Quasi Parallel

High B Variance, High Energetic Particles, Low Anisotropy

MMS1: $X=9.3 R_E$, $Y=-2.8 R_E$, $Z=-0.6 R_E$ (GSE)

Kinetic Energy Density

Kinetic Energy Density Ratio

Temperature

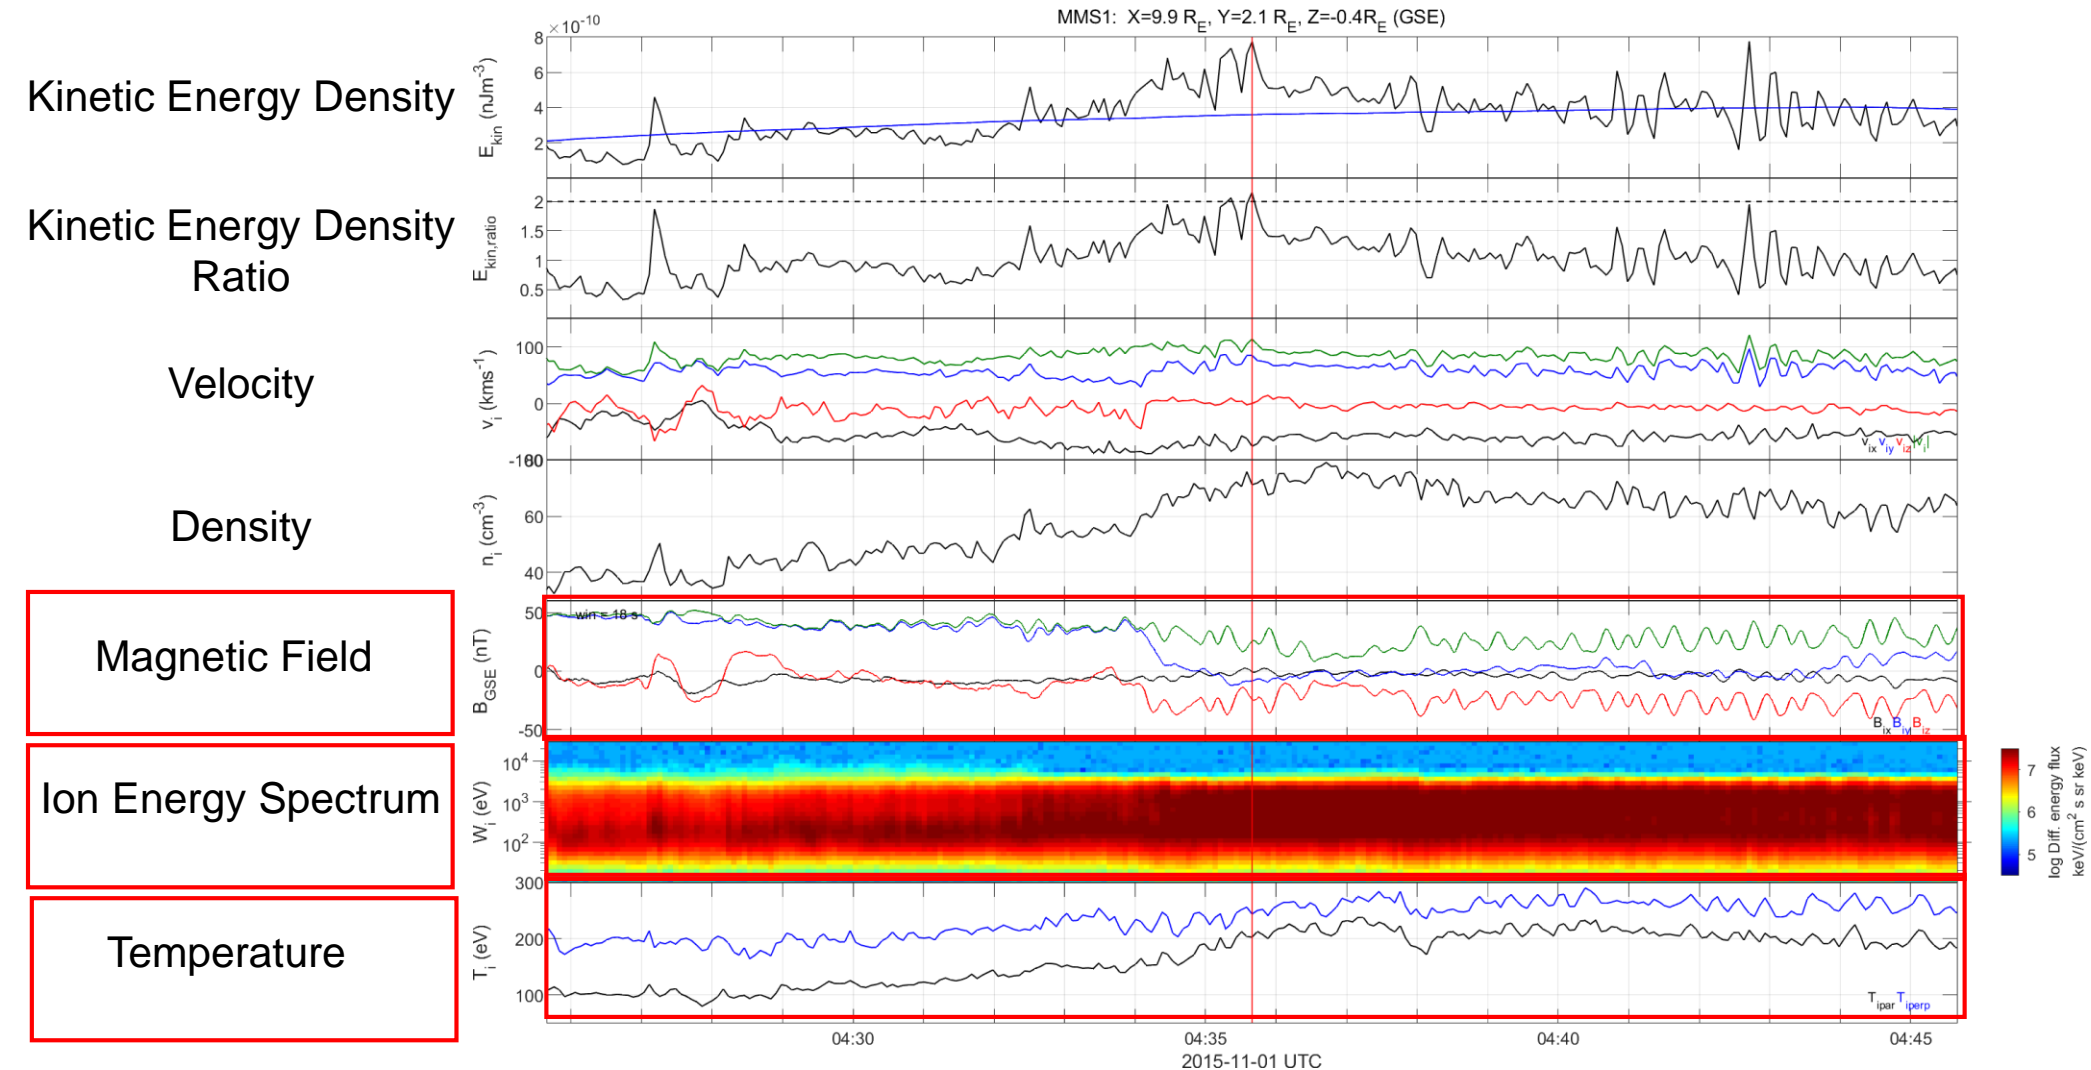

00:45 00:50 00:55 01:00 2015-11-30 UTC

How Jet look like – Quasi Perpendicular

Low B Variance, Low Energetic Particles, High Anisotropy

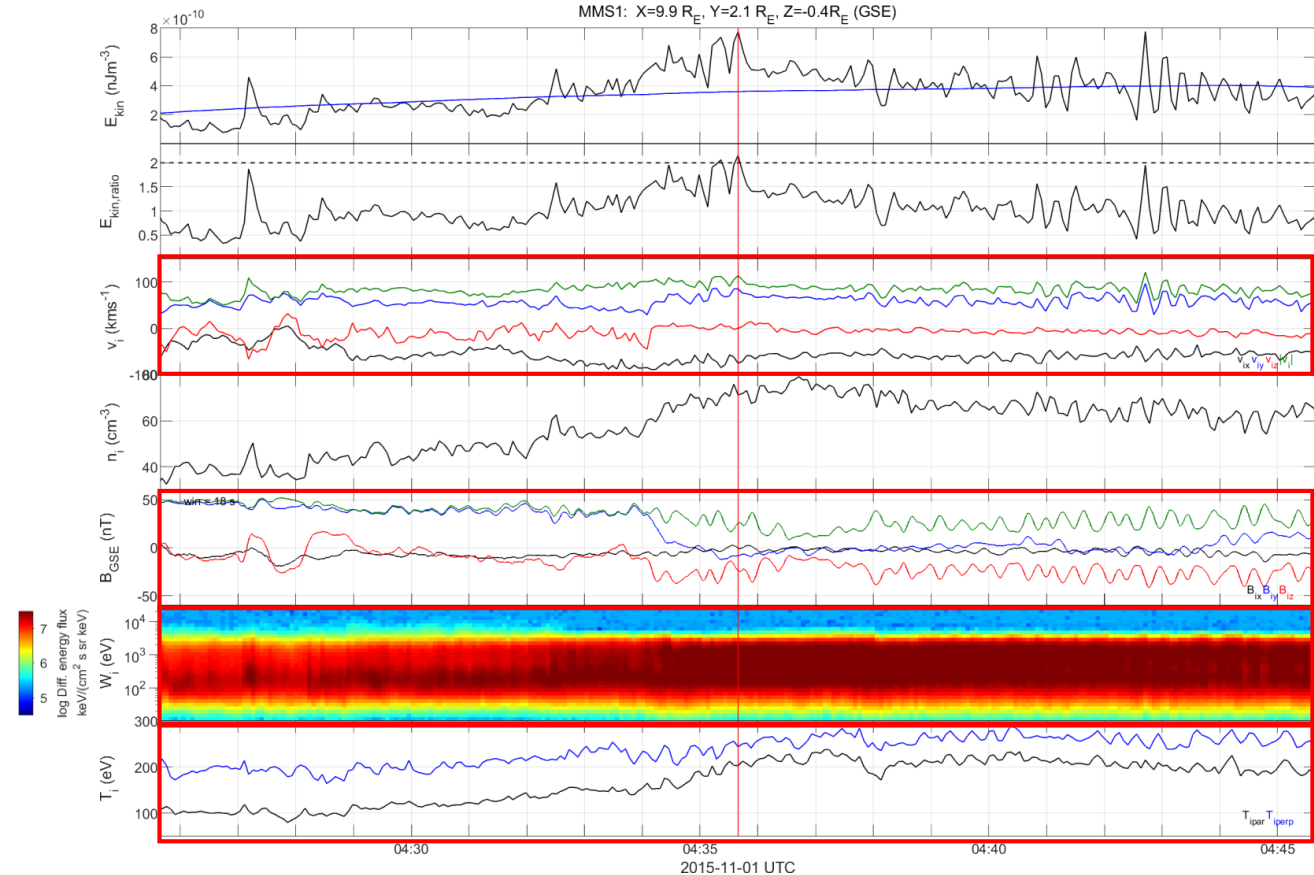

See the differences?

High Variance, High Energetic Particles, Low Anisotropy

Quasi – Parallel Jet

Low Variance, No Energetic Particles, High Anisotropy

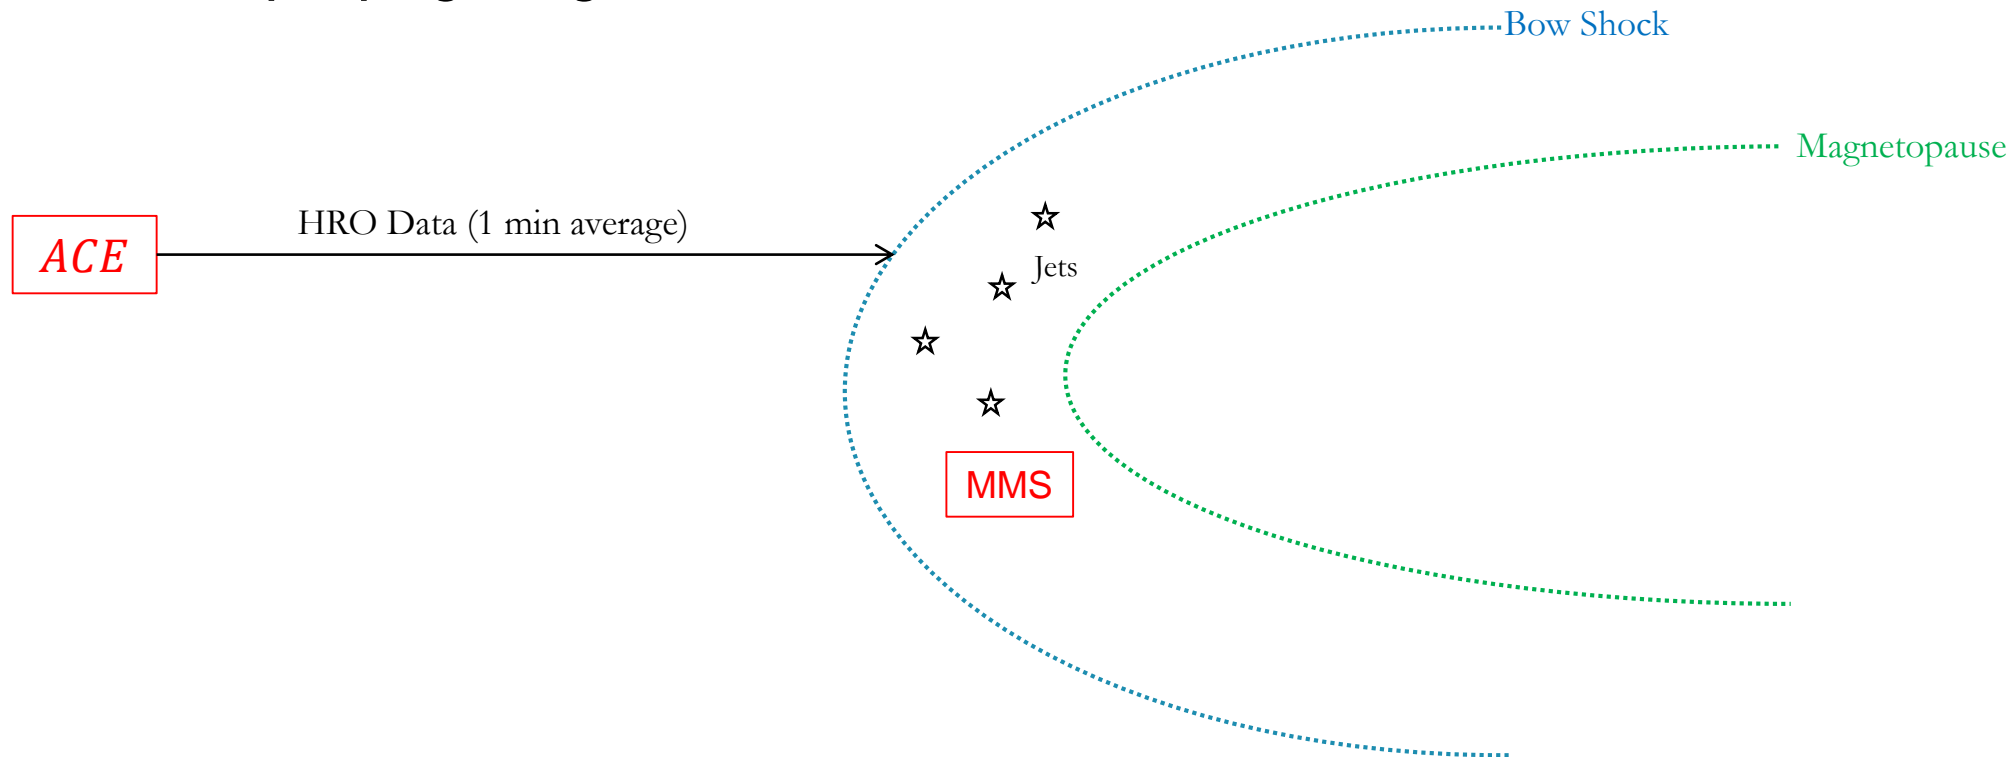

Quasi – Perpendicular

Angle & Bow shock configuration

Why not directly θ_n from Solar wind data ?

- Worse availability
- Error in propagating to Bow shock

Angle & Bow shock Verification

Q-par region

Angle & Bow shock Verification

Q-perp region

More Verification

Ion Spectrum (1:32)

Cone Angle (SW)

Very High Flux (30:32)

High Flux (27:29)

Temperature Anisotropy

$$\sum_i \sigma(B_i)$$

Jets criteria & database

Table 1. Initial dataset of the magnetosheath jets for the period 10/2015 - 04/2019.

Subset	Number (n)	Percentage (%)	Criteria
Basic	16034	100	Eq. (1)
Down-sampled	8499	53	Eqs. (1), (3)
High-Energetic	4369	27	Eqs. (1), (3), (4)

$$P_{msh} \geq 2\langle P_{msh} \rangle_{10 \text{ min}}$$

(1)

$$t_{start,i+1} - t_{end,i} = dt \geq 60s$$

(3)

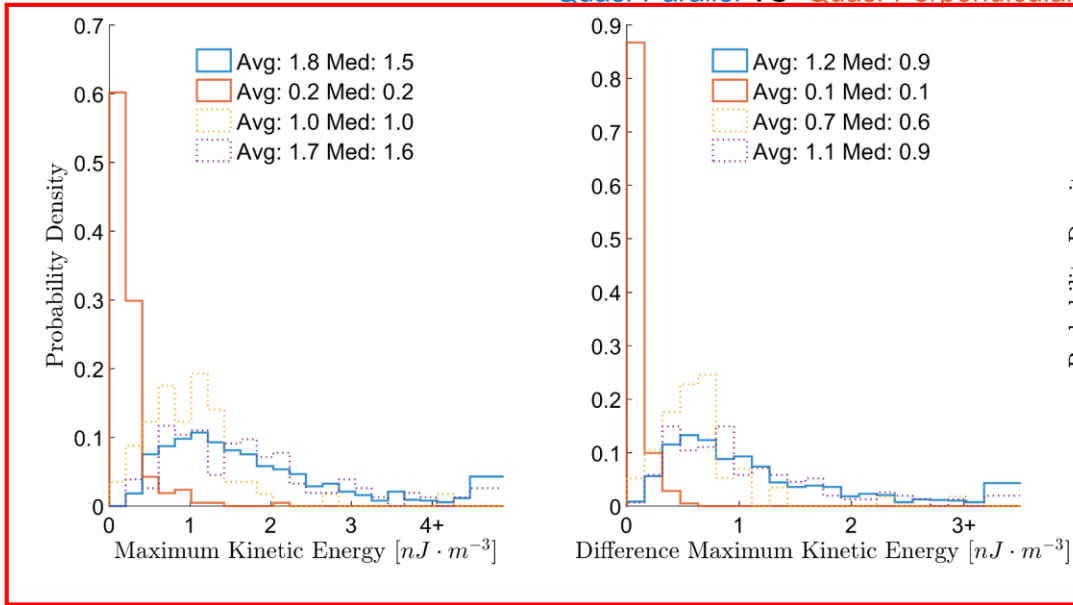

$$E_{kin,max} \geq 1 \text{ nJ/m}^{-3}$$

(4)

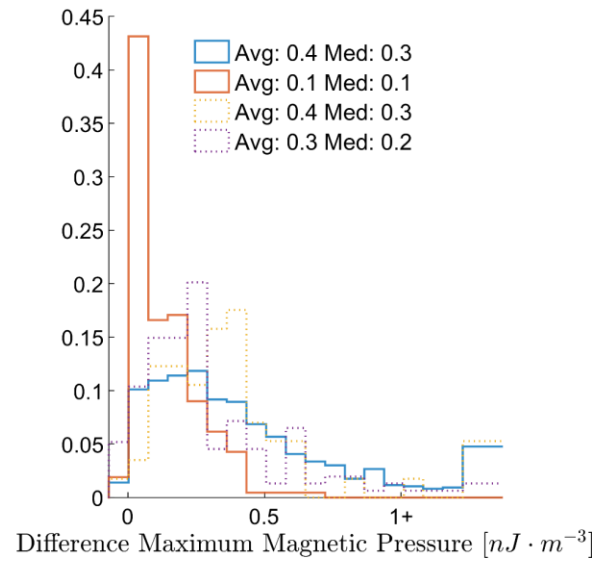

Database Jet - Classified

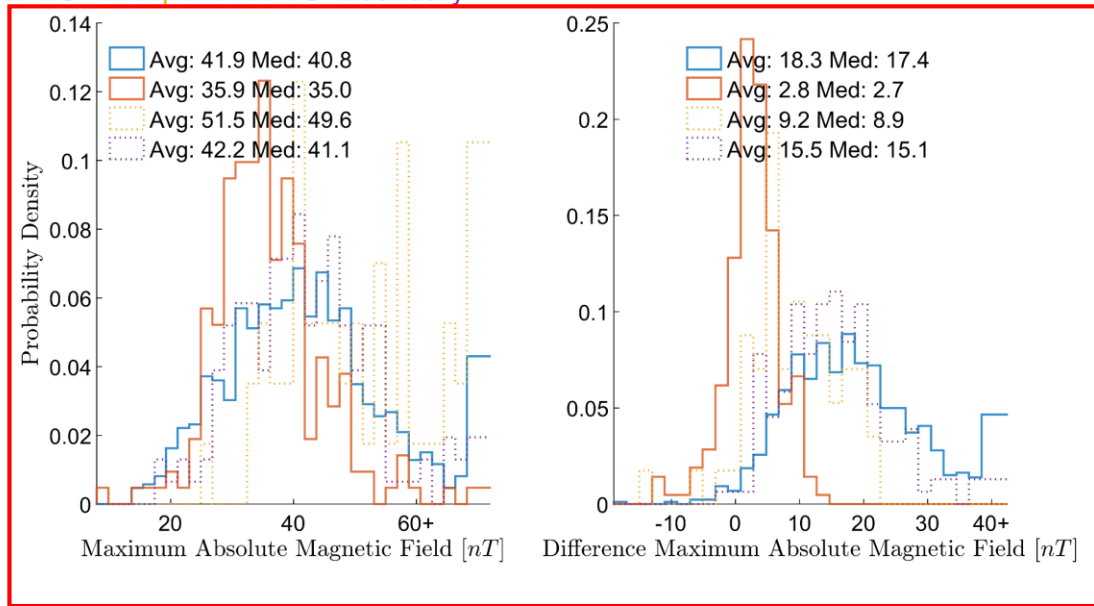

Table 3. Classified dataset of the magnetosheath jets for the period 10/2015 - 04/2019. Using as initial dataset the "down-sampled" jets of Table 1. The properties of each class is shown in Table 2.

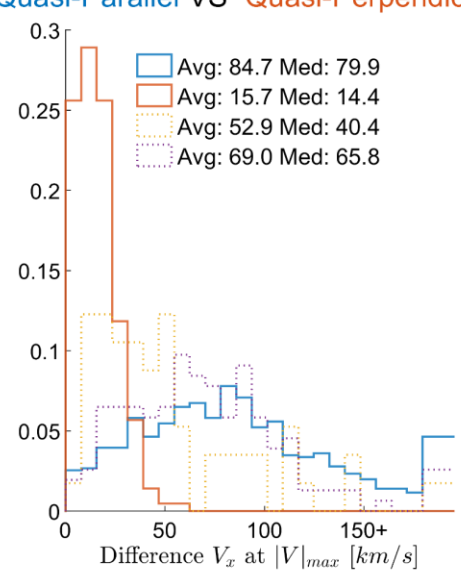

Subset	Number	Percentage (%)
Quasi - Parallel	2284	26.9
Best Cases	860	10.1
Quasi - Perpendicular	504	5.9
Best Cases	211	2.5
Boundary	744	8.8
Best Cases	154	1.8
Encapsulated	77	0.9
Best Cases	57	0.7
Other	4890	57.5
Uncertain	3499	41.2
Border	1346	15.8
Data Gap	45	0.5

$$\Delta x = x_{\text{Jet}} - \langle x \rangle_{\pm 5 \text{ min}}$$

Conclusion

Summary

- Obtained a vast **database of Magnetosheath Jets** (~10.000) using all available **MMS** data.
- Successfully **classified jets into several different categories** showing different attributes.
- Analyzed their **characteristics** and found **interesting similarities & differences** compared to earlier results.
- Possible connections to other associated mechanisms such as **SLAMS** & **Bow shock ripples**.
